Printing and manufacturing of stickers and labels

Integrated production of a wide variety of stickers and labels

Business outline

Taniguchi Seal Printing handles a wide variety of products in small lots centred on intermittent rotary letterpress printing

Taniguchi Seal Printing was founded with one flat pressure label printing machine. The company introduced intermittent rotary printers quickly to provide high quality labels. Later, the company also introduced a back printing unit, a variable printer, a glue killing machine for POP labels, and inkjet printers. In addition, the introduction of image inspection equipment has also enabled high-precision

inspections, and the company has delivered products to a wide range of fields, from light electrical appliances to chemicals, food, stationery, etc., and is trusted highly. Currently, centred on intermittent rotary letterpress printing machines, the company also handles small-lot production of a wide variety of products using flat press machines, foil stamping machines and inkjet printers. Taniguchi Seal Printing provides products in line with customer needs by specialising in stickers and labels, using everything from variable printing, glue killing, back-side printing, full-cut processing, roll finishing with a slitter machine and packaging.
